

(A2) Cryptographic Failure :

- Challenge 1 : Base64 Encoding

Easy challenge give u encoded words with base64

Use cyberchef to decode it

Username is mohammed, password is secret

Basic Authentication

Basic authentication is sometimes used by web applications. This uses base64 encoding. Therefore, it is important to at least use Transport Layer Security (https) to protect others from reading the username password that is sent to the server.

```
$echo -n "myuser:mypassword" | base64  
bXl1c2VyOm15cGFzc3dvcnQ=
```

The HTTP header will look like:

```
Authorization: Basic bXl1c2VyOm15cGFzc3dvcnQ=
```

Now suppose you have intercepted the following header:

Authorization: Basic bW9oYW1tZWQ6c2VjcmV0

Then what was the username

and what was the password:

Congratulations. That was easy, right?

-Challenge 2 : Other encoding :

Encoded password with XOR is : Oz4rPj0+LDovPiwsKDAtoW==

Use grok3 to decode it

```
XOR:
text
3b ^ 5f = 64 (d)
3e ^ 5f = 61 (a)
2b ^ 5f = 74 (t)
3e ^ 5f = 61 (a)
3e ^ 5c = 62 (b)
2c ^ 4d = 61 (a)
3a ^ 49 = 73 (s)
2f ^ 4a = 65 (e)
3e ^ 4e = 70 (p)
2c ^ 4d = 61 (a)
28 ^ 5b = 73 (s)
20 ^ 53 = 73 (s)
3d ^ 4a = 77 (w)
3b ^ 5f = 64 (d)
```

Password is databasepassword

Assignment

Now let's see if you are able to find out the original password from this default XOR encoded string.

Suppose you found the database password encoded as {xor}Oz4rPj0+LDovPiwsKDAtoW==

What would be the actual password

Congratulations.

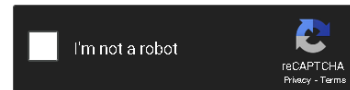

Challenge 3 : Plain Hashing :

1- Use crack station website to crack hashes

5F4DCC3B5AA765D61D8327DEB882CF99

Is password and type is md5

5F4DCC3B5AA765D61D8327DEB882CF99

Crack Hashes

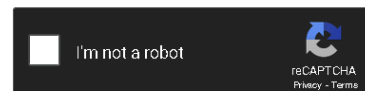

Supports: LM, NTLM, md2, md4, md5, md5(md5_hex), md5-half, sha1, sha224, sha256, sha384, sha512, rpeMD160, whirlpool, MySQL 4.1+ (sha1(sha1_bin)), QubesV3.1BackupDefaults

Hash	Type	Result
5F4DCC3B5AA765D61D8327DEB882CF99	md5	password

2- Password is secret and type is sha256

3- 2BB80D537B1DA3E38BD30361AA855686BDE0EACD7162FEF6A25FE97BF527A25B

2BB80D537B1DA3E38BD30361AA855686BDE0EACD7162FEF6A25FE97BF527A25B

Crack Hashes

Supports: LM, NTLM, md2, md4, md5, md5(md5_hex), md5-half, sha1, sha224, sha256, sha384, sha512, rpeMD160, whirlpool, MySQL 4.1+ (sha1(sha1_bin)), QubesV3.1BackupDefaults

Hash	Type	Result
2BB80D537B1DA3E38BD30361AA855686BDE0EACD7162FEF6A25FE97BF527A25B	sha256	secret

- Challenge 3 : RSA Signatures :

Determine the modulus of the RSA key as a hex string, and calculate a signature for that hex string using the key.

1- Take private key and store in file (c.pem)

2- Run openssl command to extract modulus from private key

```
PS C:\Users\mh855\Downloads> openssl rsa -in c.pem -noout -modulus
Modulus=A2DE545E5A8E68049AB8590494D96570188C56BE78E11DAC2EB9F57285234D537576CECEB242D8B957F471C4833FE55D7E0CFDE3B989DCBC
6A0882DEC8A4A7957F9BF2CB3D3FB140C6461488A5279813D8F205E2A6780F939543C3743392673523B37B1239ED2BCA3B97991E4F6EEB462D641BEF
8225835F40E5B2D1735B9BC26E5AF11029ABC2A1DAEB8FFA031589FD7EECDBB12000FAA5E3D17C64CDFBC49882831F1595DB0630220C5F44AB214077F46FE1B4664BF8B37345AF423
FD1BF86D1992FE2CDD16BD08FD903C9752F7D506285982AF4F5792A80A08FE55E7ADC0BBEB9B25555BAD44EA775C617F31AA8D2DE47F4265D695A27
49BF051FF70561A6841B35E3EBE0825A1B58AE39
PS C:\Users\mh855\Downloads>
```

3- Get the modulus then calculate signature :

-Hashing the input data (e.g., using SHA-256, a common default for RSA signatures).

- Signing the hash with the private key to produce a signature.

4- Convert hex to binary

```
A2DE545E5A8E68049AB8590494D96570188C56BE78E11DAC2EB9F57285234D537576CECEB242D8B957F471C4833FE5

```

The signature is computed by:

1. Converting the modulus hex string to its binary representation (raw bytes).
2. Computing the SHA-256 hash of those bytes.
3. Signing the hash with the private key using RSA.
4. Encoding the resulting 256-byte signature in **Base64** (WebGoat's required format, as per,,).
